Certified 22", 24", 27" & 30" models 100435, 100566, 100567 & 100568

NOTICE: Only the left axle has two holes, and the axle pin can be removed and repositioned. It is **optional** to slide one wheel past the pin hole in the axle and to place the locking pin into the axle outside the wheel without locking it into the drive axle. This creates a pivot wheel that allows the operator to easily turn the snowblower during use by using the "free wheel" as a pivot point. Though this makes turning easier, it decreases drive wheel traction by 50%. Below will show how to convert this to a 2 wheel drive system.

1. If the wheel is slid further in on the axle with the pin inserted into the outside hole of the axle, the machine will move freely without the engine on. (One Wheel Drive)

2. If the pin is inserted into the inside hole of the axle, the machine will only move when the drive control is engaged when the engine is on. (Two Wheel Drive)
